1 Introduction

Epidermal growth factor receptor (EGFR) is a receptor tyrosine kinase.
Mutations such as T790M confer resistance to first generation inhibitors.

2 Methods

2.1 In vitro assay

Cells were cultured and treated with gefitinib at increasing doses.
IC50 values were fitted with a four parameter logistic model.

3 Results

Osimertinib retained activity against the T790M mutant.

The measured IC50 was 12 nM in the resistant cell line.
